

Pseudoerythromycin A enol ether

Code No.: **BIA-P1349**

Pack sizes: **1 mg, 5 mg**

Synonyms :

Specifications

CAS #	:	105882-69-7
Molecular Formula	:	C₃₇H₆₅NO₁₂
Molecular Weight	:	715.9
Source	:	Semi-synthetic
Appearance	:	White solid
Purity	:	>98% by HPLC
Long Term Storage	:	-20°C
Solubility	:	Soluble in ethanol, methanol, DMF or DMSO. Good water solubility.

Application Notes

Pseudoerythromycin A enol ether is a degradation product of erythromycin formed by a complex internal rearrangement of erythromycin A on exposure to neutral to weakly alkaline conditions. The C6-OH forms an internal enol ether with the C9 ketone of erythromycin, while the C11-OH attacks the carbonyl of the lactone to reduce the macrocycle from a 14- to an 11-membered macrolide. Synthetically, pseudoerythromycin A enol ether is prepared by reacting erythromycin enol ether with carbonate. Pseudoerythromycin A enol ether is devoid of antibiotic activity but is an important analytical standard for erythromycin A stability studies.
