

Tunicamycin complex

Code No.: **BIA-T1095**

Pack sizes: **5 mg, 25 mg**

Synonyms :

Specifications

CAS #	: 11089-65-9
Molecular Formula	: C₃₈H₆₂N₄O₁₆ (for IV)
Molecular Weight	: 830.4
Source	: <i>Streptomyces</i> sp.
Appearance	: White to off-white solid
Purity	: >99% by HPLC (total complex)
Long Term Storage	: -20°C
Solubility	: Soluble in ethanol, methanol, DMF or DMSO. Poor water solubility.

Application Notes

The tunicamycins are a family of lipophilic nucleosides with fatty acids conjugated to an aminoglycoside group. The complex comprises the analogues, tunicamycins I to X. This composition is typical of other products less precisely described as tunicamycins A to D. The tunicamycins act by blocking the formation of N-glycoside linkages to proteins via inhibition of formation of dolichol monophosphate from N-acetylglucosamine-1-phosphate. Tunicamycin blocks the synthesis of all N-linked glycoproteins (N-glycans) and causes cell cycle arrest in G1 phase. Tunicamycins are broadly active against prokaryotes, eukaryotes and viruses.
